

# Tech-enabled waste solutions

## Smartphone Tipping App

# Technology driven

## The waste industry is changing and Reconomy continues to lead the way.

The process of tipping waste and backhauling materials can be an expensive and time consuming process, particularly if long distances are involved. To help streamline this process, Reconomy has as part of its suite of apps, The Tipping App, which is available on both Android and ISO Smartphones.

As your portable waste management planner, our Tipping App can save your business time and money by improving the efficiency of your fleet's daily scheduling for all tipping and collecting jobs.

## Improve efficiencies

**The Tipping App uses the latest geo-fencing technology, allowing your drivers to best utilise Reconomy's large network of transfer stations and recycling centres.**

With access to more than 1,500 tipping locations all around the UK, the App will help identify the most efficient tipping or collection options for you, based on the type of waste being carried, current vehicle positioning and the postcode of the next onward journey.

Upon completion of a job, the App will also give immediate access to tonnages and other critical waste data via the Reconomy Portal, saving you the hassle of having to wait for paperwork to arrive

# Unique benefits

With responsibility for managing approximately 3m tonnes of waste per year, we are committed to using the latest technology to streamline waste management and disposal processes. Some of the many benefits of using our Tipping App include:

## Create new jobs and orders

Reduce administration and the need for 'over the phone' contact between your office staff and drivers by uploading jobs and orders directly to the App. Each job can then be individually accepted by the driver and scheduled into their workload.

## Driver updates

The Reconomy Tipping App enables drivers to provide updates on individual jobs as their status changes. This ensures you are always up-to-date and saves you the hassle of having to contact drivers for information.

### Optimised route planning

The App takes onward journeys into account when planning your next tipping or collection point. This not only saves time, it also minimises the carbon footprint and fuel costs of your fleet.

---

### ETAs and vehicle positioning

Powered by Google Maps, the App provides accurate GPS positioning of all your vehicles. Drivers can also manually enter their estimated times of arrival (ETA) for each job based on the optimised routes recommended by the App.

---

### Instant data capture

All your tipping and collection tonnages are directly inputted into the App at the point of weighing, giving immediate access to important data. This is supplied together with confirmation signatures from both the driver and weighbridge operator.
